

Exercises: Interfaces and Abstraction

This document defines the exercises for ["Java OOP" course @ Software University](#). Please submit your solutions (source code) of all below described problems in [Judge](#).

Problem 1. Define an Interface Person

Define an interface **Person** with methods **getName** and **getAge**. Define a class **Citizen** which implements **Person** and has a constructor which takes a **String name** and an **int age**.

Add the following code to your main method and submit it to Judge.

<<Interface>>	
Person	
+ getName() : String	
+ getAge() : int	

Citizen	
- name: String	
- age: int	
+ Citizen (String, int)	
+ getName() : String	
+ getAge() : int	

```
public static void main(String[] args) {
    Class[] citizenInterfaces = Citizen.class.getInterfaces();
    if(Arrays.asList(citizenInterfaces).contains(Person.class)){
        Method[] fields = Person.class.getDeclaredMethods();
        Scanner scanner = new Scanner(System.in);
        String name = scanner.nextLine();
        int age = Integer.parseInt(scanner.nextLine());
        Person person = new Citizen(name,age);
        System.out.println(fields.length);
        System.out.println(person.getName());
        System.out.println(person.getAge());
    }
}
```

If you defined the interface and implemented it correctly, the test should pass.

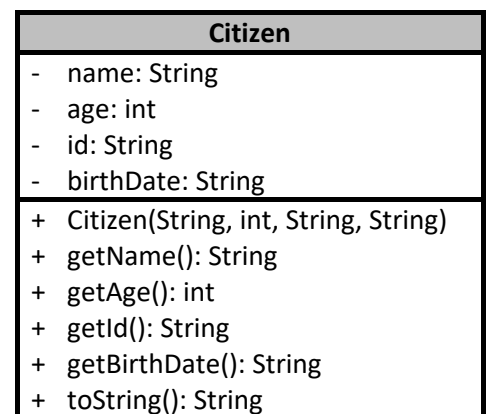

Examples

Input	Output
Pesho 25	2 Pesho 25

Problem 2. Multiple Implementation

Using the code from the previous task, define an interface **Identifiable** with a **String** method **getId** and an interface **Birthable** with a **String** method **getBirthDate** and implement them in the **Citizen** class. Rewrite the **Citizen** constructor to accept the new parameters.

Add the following code to your main method and submit it to Judge.

```

public static void main(String[] args) {
    Class[] citizenInterfaces = Citizen.class.getInterfaces();
    if (Arrays.asList(citizenInterfaces).contains(Birthable.class)
        && Arrays.asList(citizenInterfaces).contains(Identifiable.class)) {
        Method[] methods = Birthable.class.getDeclaredMethods();
        methods = Identifiable.class.getDeclaredMethods();
        Scanner scanner = new Scanner(System.in);
        String name = scanner.nextLine();
        int age = Integer.parseInt(scanner.nextLine());
        String id = scanner.nextLine();
        String birthDate = scanner.nextLine();
        Identifiable identifiable = new Citizen(name, age, id, birthDate);
        Birthable birthable = new Citizen(name, age, id, birthDate);
        System.out.println(methods.length);
        System.out.println(methods[0].getReturnType().getSimpleName());
        System.out.println(methods.length);
        System.out.println(methods[0].getReturnType().getSimpleName());
    }
}

```

If you defined the interfaces and implemented them, the test should pass.

Examples

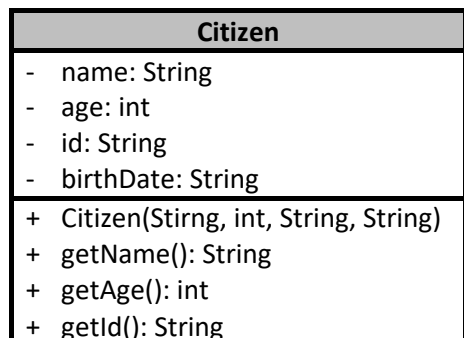

Input	Output
Pesho	1
25	String
9105152287	1
15/05/1991	String

Problem 3. Birthday Celebrations

It is a well known fact that people celebrate birthdays, it is also known that some people also celebrate their pets birthdays. Extend the program from your last task to add **birthdates** to citizens and include a class **Pet**, pets have a **name** and a **birthdate**. Also create class **Robot** which has an **id** and **model**. Encompass repeated functionality into interfaces and implement them in your classes.

You will receive from the console an unknown amount of lines until the command "End" is received, each line will contain information in one of the following formats "Citizen <name> <age> <id> <birthdate>" for citizens, "Robot <model> <id>" for robots or "Pet <name> <birthdate>" for pets. After the end command on the next line

you will receive a single number representing a **specific year**, your task is to print all birthdates (of both citizens and pets) in that year in the format **day/month/year** (the order of printing doesn't matter).

Examples

Input	Output
Citizen Pesho 22 9010101122 10/10/1990 Pet Sharo 13/11/2005 Robot MK-13 558833251 End 1990	10/10/1990
Citizen Stamat 16 0041018380 01/01/2000 Robot MK-10 12345678 Robot PP-09 00000001 Pet Topcho 24/12/2000 Pet Kosmat 12/06/2002 End 2000	01/01/2000 24/12/2000
Robot VV-XYZ 11213141 Citizen Penka 35 7903210713 21/03/1979 Citizen Kane 40 7409073566 07/09/1974 End 1975	<no output>

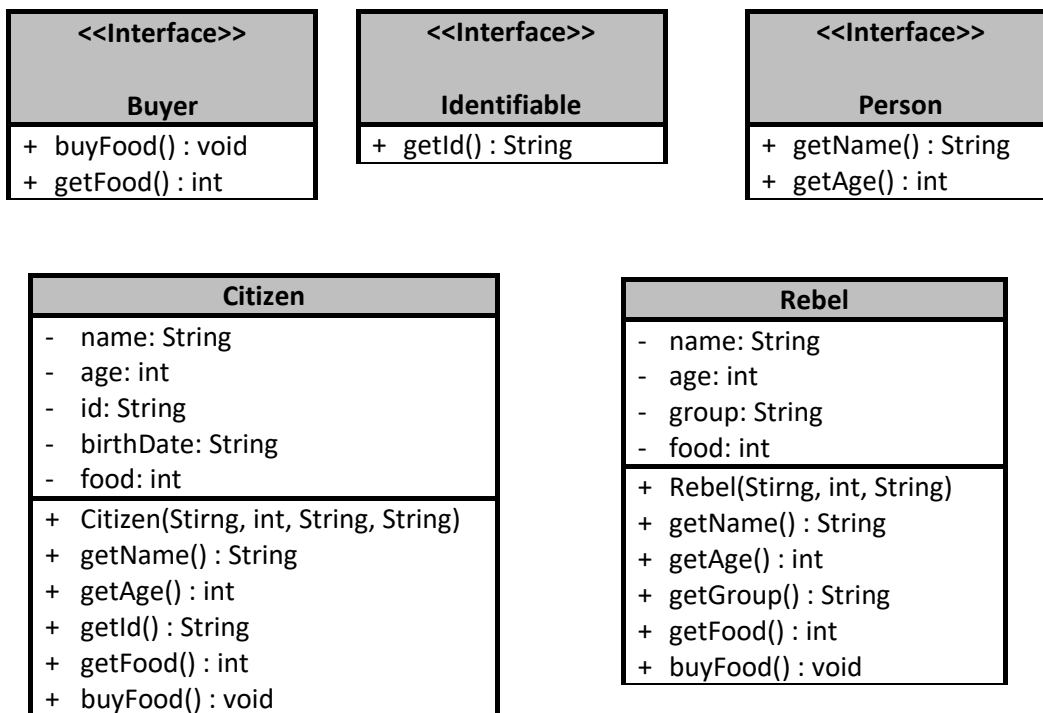

Problem 4. Food Shortage

Your totalitarian dystopian society suffers a shortage of food, so many rebels appear. Extend the code from your previous (Problem 2. **Multiple Implementation**) task with new functionality to solve this task.

Define a class **Rebel** which has a **name**, **age** and **group** (String), names are **unique** - there will never be 2 Rebels/Citizens or a Rebel and Citizen with the same name. Define an interface **Buyer** which defines a methods **buyFood()** and a **getFood()**. Implement the **Buyer** interface in the **Citizen** and **Rebel** class, both Rebels and Citizens **start with 0 food**, when a Rebel buys food his **food** increases by **5**, when a Citizen buys food his **food** increases by **10**.

On the first line of the input you will receive an integer **N** - the number of people, on each of the next **N** lines you will receive information in one of the following formats "<name> <age> <id> <birthdate>" for a Citizen or "<name> <age><group>" for a Rebel. After the **N** lines until the command "End" is received, you will receive names of people who bought food, each on a new line. Note that not all names may be valid, in case of an incorrect name - nothing should happen.

On the only line of output, you should print the total amount of food purchased.

Examples

Input	Output
2 Pesho 25 8904041303 04/04/1989 Stanco 27 WildMonkeys Pesho Gosho Pesho End	20
4 Stamat 23 TheSwarm Toncho 44 7308185527 18/08/1973 Joro 31 Terrorists Penka 27 881222212 22/12/1988 Jiraf Joro Jiraf Joro Stamat Penka End	25

Problem 5. Telephony

You have a business - **manufacturing cell phones**. But you have no software developers, so you call your friends and ask them to help you create a cell phone software. They agree and you start working on the project. The project consists of one main **model** - a **Smartphone**. Each of your smartphones should have functionalities of **calling other phones** and **browsing in the world wide web**.

Your friends are very busy, so you decide to write the code on your own. Here is the mandatory assignment:

You should have a **model** - **Smartphone** and two separate functionalities which your smartphone has - to **call other phones** and to **browse in the world wide web**. You should end up with **one class** and **two interfaces**.

<<Interface>>
Callable
+ call(): String

<<Interface>>
Browsable
+ browse(): String

Smartphone
- numbers: List<String> - urls: List<String>
+ Smartphone(List<String>, List<String>) + call(): String + browse(): String

Input

The input comes from the console. It will hold two lines:

- **First line:** phone numbers to call (String), separated by spaces.
- **Second line:** sites to visit (String), separated by spaces.

Output

- First **call all numbers** in the order of input then **browse all sites** in order of input
- The functionality of calling phones is printing on the console the number which are being called in the format: **"Calling... <number>"**
- The functionality of the browser should print on the console the site in format: **"Browsing: <site>!"** (pay attention to the exclamation mark when printing URLs)
- If there is a number in the input of the URLs, print: **"Invalid URL!"** and continue printing the rest of the URLs.
- If there is a character different from a digit in a number, print: **"Invalid number!"** and continue to the next number.

Constraints

- Each site's URL should consist only of letters and symbols (**No digits are allowed** in the URL address)

Examples

Input	Output
0882134215 0882134333 08992134215 0558123 3333 1 http://softuni.bg http://youtube.com http://www.g00gle.com	Calling... 0882134215 Calling... 0882134333 Calling... 08992134215 Calling... 0558123 Calling... 3333 Calling... 1 Browsing: http://softuni.bg! Browsing: http://youtube.com! Invalid URL!

Problem 6. *Military Elite

Create the following class hierarchy:

- **SoldierImpl** – general class for soldiers, holding **id** (int), **first name** and **last name**
 - **PrivateImpl** – lowest base soldier type, holding the field **salary**(double)
 - **LieutenantGeneralImpl** – holds a set of **PrivatesImpl** under his command
 - **public void addPrivate(Private priv)**
 - **SpecialisedSoldierImpl** – general class for all specialised soldiers – holds the **corps** of the soldier. The corps can only be one of the following: "**Airforces**" or "**Marines**" (Enumeration)
 - **EngineerImpl** – holds a set of **repairs**. A **repair** holds a **part name** and **hours worked** (int)
 - **public void addRepair(Repair repair)**
 - **public Collection<Repair> getRepairs()**
 - **CommandoImpl** – holds a set of **missions**. A mission holds **code name** and a **state** (Enumeration: "**inProgress**" or "**finished**"). A mission can be finished through the method **completeMission()**
 - **public void addMission(Mission mission)**
 - **public Collection<Mission> getMissions()**
 - **SpyImpl** – holds the **code number** of the spy.

Extract **interfaces** for each class. (e.g. **Soldier**, **Private**, **LieutenantGeneral**, etc.) The interfaces should hold their public get methods (e.g. **Soldier** should hold **getId**, **getFirstName** and **getLastName**). Each class should implement its respective interface. Validate the input where necessary (corps, mission state) - input should match **exactly** one of the required values, otherwise it should be treated as **invalid**. In case of **invalid corps** the entire line should be skipped, in case of an **invalid mission state** only the mission should be skipped.

You will receive from the console an unknown amount of lines containing information about soldiers until the command "**End**" is received. The information will be in one of the following formats:

- Private: "**Private** <id> <firstName> <lastName> <salary>"
- LieutenantGeneral: "**LieutenantGeneral** <id> <firstName> <lastName> <salary> <private1Id> <private2Id> ... <privateNId>" where privateXId will **always** be an Id of a private already received through the input
- Engineer: "**Engineer** <id> <firstName> <lastName> <salary> <corps> <repair1Part> <repair1Hours> ... <repairNPart> <repairNHours>" where repairXPart is the name of a repaired part and repairXHours the hours it took to repair it (the two parameters will always come paired)
- Commando: "**Commando** <id> <firstName> <lastName> <salary> <corps> <mission1CodeName> <mission1state> ... <missionNCodeName> <missionNstate>" a missions code name, description and state will always come together
- Spy: "**Spy** <id> <firstName> <lastName> <codeNumber>"

Define proper constructors. Avoid code duplication through abstraction. Override **toString()** in all classes to print detailed information about the object.

Privates:

"Name: <firstName> <lastName> Id: <id> Salary: <salary>"

Spy:

"Name: <firstName> <lastName> Id: <id>

Code Number: <codeNumber>"

LieutenantGeneral:

"Name: <firstName> <lastName> Id: <id> Salary: <salary>

Privates:

<private1 ToString()>

<private2 ToString()>

...

<privateN ToString()>"

Note: privates must be sorted by id in **descending order**.

Engineer:

"Name: <firstName> <lastName> Id: <id> Salary: <salary>

Corps: <corps>

Repairs:

<repair1 ToString()>

<repair2 ToString()>

...

<repairN ToString()>"

Commando:

"Name: <firstName> <lastName> Id: <id> Salary: <salary>

Corps: <corps>

Missions:

<mission1 ToString()>

<mission2 ToString()>

...

<missionN ToString()>"

Repair:

"Part Name: <partName> Hours Worked: <hoursWorked>"

Mission:

"Code Name: <codeName> State: <state>"

NOTE: Salary should be printed rounded to **two decimal places** after the separator.

Examples

Input	Output
Private 1 Pesho Peshev 22.22 Commando 13 Stamat Stamov 13.1 Airforces Private 222 Toncho Tonchev 80.08 LieutenantGeneral 3 Joro Jorev 100 222 1 End	Name: Pesho Peshev Id: 1 Salary: 22.22 Name: Stamat Stamov Id: 13 Salary: 13.10 Corps: Airforces Missions: Name: Toncho Tonchev Id: 222 Salary: 80.08 Name: Joro Jorev Id: 3 Salary: 100.00 Privates: Name: Toncho Tonchev Id: 222 Salary: 80.08 Name: Pesho Peshev Id: 1 Salary: 22.22
Engineer 7 Pencho Penchev 12.23 Marines Boat 2 Crane 17 Commando 19 Penka Ivanova 150.15 Airforces HairyFoot Finished Freedom inProgress	Name: Pencho Penchev Id: 7 Salary: 12.23 Corps: Marines Repairs: Part Name: Boat Hours Worked: 2

End	Part Name: Crane Hours Worked: 17 Name: Penka Ivanova Id: 19 Salary: 150.15 Corps: Airforces Missions: Code Name: Freedom State: inProgress
LieutenantGeneral 17 No Units 500.01 Spy 7 James Bond 007 Spy 8 James Boned 008 End	Name: No Units Id: 17 Salary: 500.01 Privates: Name: James Bond Id: 7 Code Number: 007 Name: James Boned Id: 8 Code Number: 008

Problem 7. *Collection Hierarchy

Create 3 different string collections – **AddCollection**, **AddRemoveCollection** and **MyListImpl**.

The **AddCollection** should have:

- Only a single method **add(String)** which adds an item to the **end** of the collection.

The **AddRemoveCollection** should have:

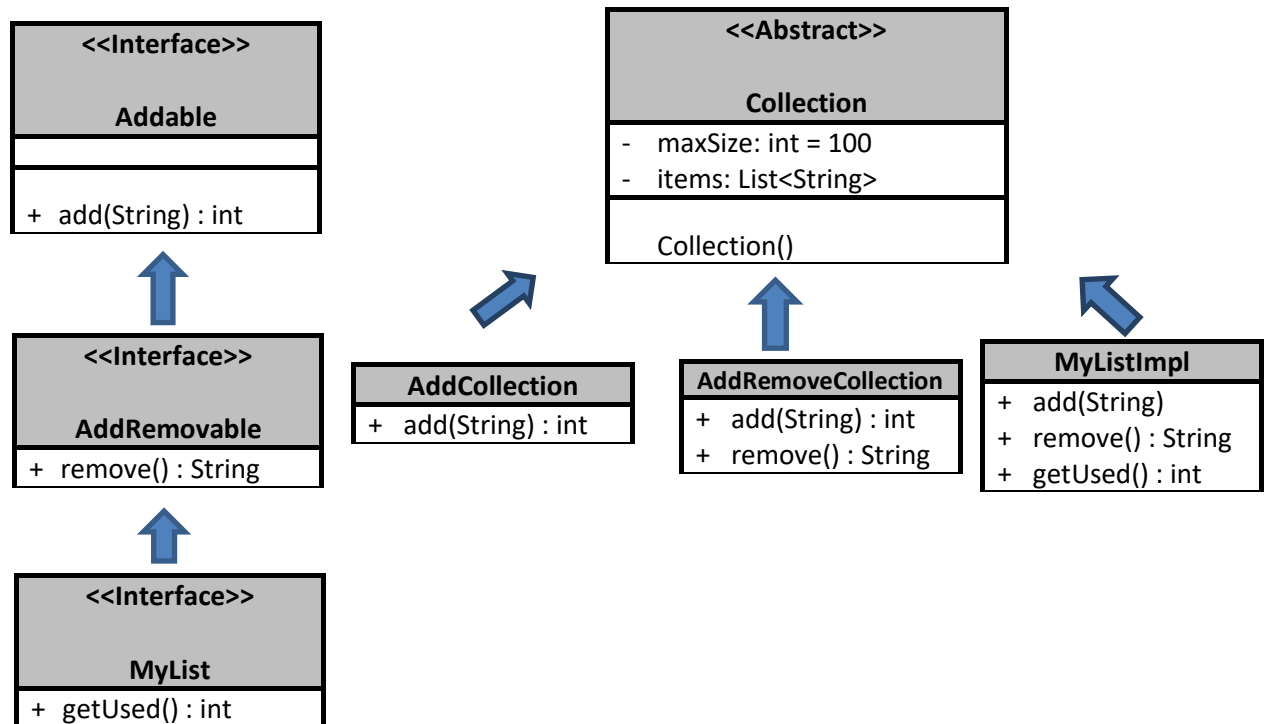

- An **add(String)** method – which adds an item to the **start** of the collection.
- A **remove()** method which removes the **last** item in the collection.

The **MyListImpl** collection should have:

- An **add(String)** method which adds an item to the **start** of the collection.
- A **remove()** method which removes the **first** element in the collection.
- A **used** field which displays the size of elements currently in the collection.

Create interfaces which define the collections functionality, think how to model the relations between interfaces to reuse code. Add an extra bit of functionality to the methods in the custom collections, **add** methods should return the index in which the item was added, **remove** methods should return the item that was removed.

Your task is to create a single copy of your collections, after which on the first input line you will receive a random amount of strings in a single line separated by spaces - the elements you have to add to each of your collections. For each of your collections write a single line in the output that holds the results of all **add operations** separated by spaces (check the examples to better understand the format). On the second input line you will receive a single number - the amount of **remove operations** you have to call on each collection. In the same manner as with the **add** operations for each collection (except the AddCollection), print a line with the results of each **remove** operation separated by spaces.

Input

The input comes from the console. It will hold two lines:

- The first line will contain a random amount of strings separated by spaces - the elements you have to **add** to each of your collections.
- The second line will contain a single number - the amount of **remove** operations.

Output

The output will consist of 5 lines:

- The first line contains the results of all **add** operations on the **AddCollection** separated by spaces.
- The second line contains the results of all **add** operations on the **AddRemoveCollection** separated by spaces.
- The third line contains the result of all **add** operations on the **MyListImpl** collection separated by spaces.
- The fourth line contains the result of all **remove** operations on the **AddRemoveCollection** separated by spaces.
- The fifth line contains the result of all **remove** operations on the **MyListImpl** collection separated by spaces.

Constraints

- All collections should have a **length of 100**.
- There will never be **more than 100** add operations.
- The number of remove operations will never be more than the amount of add operations.

Examples

Input	Output
apple orange peach 3	0 1 2 0 0 0 0 0 0 apple orange peach

	peach orange apple
one two three four five six seven 4	0 1 2 3 4 5 6 0 0 0 0 0 0 0 0 0 0 0 0 0 0 one two three four seven six five four

Hint

Create an interface hierarchy representing the collections. You can use a List as the underlying collection and implement the methods using the List's add, remove and insert methods.
